

HW11

Building off of HW9, add the following:

- An endpoint that allows you to create/delete departments
- An endpoint that allows you to create/delete courses

Departments should have an ID, Name, and School_ID

Courses should have an ID, Name, and Dept_ID

The relationship between the school, department and course tables should be managed appropriately so that a user cannot create a department that does not belong to a valid school and a course cannot be created that belong to an invalid department.

Any action taken while your API is running should be logged to a file called `app.log`. If it's just a normal action, they should be logged at the debug level. If it's an error, it should be logged at the error level.
